Dinesh-Saladi

dinesh-saladi-07a441290

EDUCATION

•National Institute of Technology, Warangal

2023-2027

Bachelor of Technology in Computer Science and Engineering

CGPA: 8.62

EXPERIENCE

•Microsoft

May 2026 – July 2026

Software Engineering Intern

Hyderabad, India

- Designed and built a 9-agent orchestration system automating an end-to-end security-fix pipeline, verified across 5 real security cases with 230 automated tests.
- Architected deterministic orchestration over probabilistic AI agents using structured JSON contracts, enabling reliable, testable routing and control flow.
- Engineered resilient execution for long-running workflows through isolated per-run processes, durable on-disk state, resume-after-restart, and rollback of partial work.
- Built a React + Flask dashboard with live workflow visualization, human approval gates, and VM-based validation that redeploy fixes and re-runs PoCs to objectively verify correctness.

PERSONAL PROJECTS

•FormX: AI-Powered Custom Form Generator | GitHub

June 2025

AI-driven form builder that converts natural language into structured, dynamic forms with response collection and export capabilities.

- Designed a schema-driven form engine where form definitions exist as JSON data, enabling AI generation, drag-and-drop editing, storage, and rendering through a unified schema pipeline.
- Engineered a natural-language-to-schema pipeline using Gemini with constrained prompting and validated JSON output, reliably translating prompts into structured form schemas.
- Architected a serverless-ready backend on Neon HTTP PostgreSQL, enabling deployment across serverless environments without persistent database connections.
- Eliminated backend requests during form editing with cookie-based draft persistence, keeping high-frequency editing interactions client-side and preserving drafts across page refreshes.

•LiveBid: Real-Time Online Auction System | GitHub

May 2025

Real-time auction platform enabling concurrent bidding with low-latency updates and consistent state across clients.

- Designed a server-authoritative real-time auction engine where all mutable auction state lives in server memory, with Socket.IO rooms broadcasting synchronized state to display-only clients.
- Engineered server-serialized bid processing through a synchronous place-bid handler, exploiting Node.js's single-threaded event loop to keep the read-modify-write cycle atomic under concurrent bid events.
- Stored active auction state in an in-memory Map with deferred database persistence, achieving sub-millisecond bid processing by isolating the critical path from database latency.
- Orchestrated the full auction lifecycle through event-driven state transitions: bid events, timer expiry, item queue progression, and auction termination, coordinated entirely by server-side handlers and broadcasts.

TECHNICAL SKILLS

Languages: C++, Python, Java, JavaScript, SQL

Frontend: React, Vite, Tailwind CSS, ShadCN UI

Backend: Flask, Node.js, Express.js, REST APIs, Socket.IO

AI/Agents: LLM Orchestration, Prompt Engineering, Multi-Agent Systems

Databases: PostgreSQL, Oracle SQL

Tools & Platforms: Git, GitHub, Azure DevOps, Docker, Linux, Postman

COMPETITIVE PROGRAMMING PROFILE

•**LeetCode:** Knight | Max Rating: 1870 | 800+ Problems Solved

•**Codeforces:** Specialist | Max Rating: 1436

•**CodeChef:** 3★ | Max Rating: 1681 | Starters 188: Rank 90

ACHIEVEMENTS

•**Amazon ML Summer School 2026** Selected among ~3,000 participants from 133K+ registrations.

•**GPT Search** Published on the VS Code Marketplace with 229+ installs.
